

ABSTRACT OF  
THE DISCLOSURE

Methods, apparatus, and articles of manufacture for transferring data from a defined source business component to a defined destination business component and/or between user-specified fields associated with the defined business components are disclosed herein. Embodiments of the invention enable a user to populate data fields of a first user interface display with data previously entered in data fields of a second user interface display by mapping the location of the data within a database, to the data fields of the first user interface display.
